

I Claim:

1. A urine collection device comprising:

a specimen container body having an inner wall and an outer wall, wherein the inner wall and the outer wall define a collection cavity, a fluid collection and retrieval opening, and a rim;

a handle having a first body member and a second body member, the first body member having a first contact member which, in turn, has a first contact surface and an inner surface, and the second body member having a second contact member having a second contact surface and an outer surface,

wherein the first contact surface engages the inner wall of the specimen container body, and the second contact surface engages the outer wall of the specimen container, removably securing the handle to the specimen container body.

2. A method of collecting urine comprising the steps of:

a) positioning the first contact member of the first body member adjacent to the rim formed by the specimen container body, with the first contact member protruding into the collection cavity and the first contact surface facing the inner wall of the specimen container body;

b) positioning the second contact member of the second body member adjacent to the rim formed by the specimen container body, with the second contact surface of the second contact member facing the outer wall of the specimen container body;

c) securing the handle to the rim of the specimen container body, such as by moving the second body member in a first direction until the first contact surface of the first contact member engages the inner wall of the specimen container body, and the second contact surface of the second contact member engages the outer wall of the specimen container body; and

d) removing the handle, such as by moving the second body member in a second, opposite direction.
